# Measuring Instructions for the *erektor*™

Measure Length:
All measurements must be performed on a non-erect FULLY stretched penis.

1. Use only Length Measurement ruler for length measurement. Do not substitute any other ruler for measurement. Use only the supplied measuring belt, and use the number side of the measuring belt only.

2. Hold the measuring belt provided at the end marked "0" at the base of your penis. Hold the tip of your non-erect penis and stretch it out as far as you comfortably can. Do not stretch the penis beyond the maximum comfortable point. Lay the measuring belt on top of your penis. Press the "0" end firmly toward the pelvic bone. Measure to the tip of the head. In this example (figure1) the belt measures between 8 and 9. If the measurement is in between numbers, use the lower number.
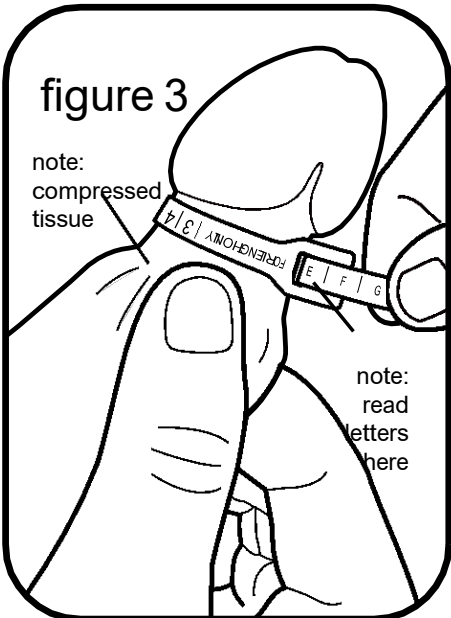

Enter length number here:_____

Measure Circumference/Girth:
All measurements must be performed on a non-erect penis.

1.Use only Circumference Measurement ruler for circumference measurement. Do not substitute any other ruler for measurement. Use only the supplied measuring belt, and use the letter side of the measuring belt only.

2. Fully pull or roll back the skin behind the head under the penis (figure2). Feed the end of the belt through the slot to create a loop with the numbers facing up. Cinch the measuring belt tightly and directly behind the glans (head). This is the circumference. Notice how the shaft under the belt is more narrow because of firm squeezing by the belt. In this example (figure3) the belt measures between D and E. If the measure is in between letters, use the lower letter.

Enter circumference/girth letters here:_____

Once you've completed your measurements, please, place your order on our website: http://erektor.com/shop/, Select options.
